5 Amazing Trick For

HTML

Time Page Refreshes & Redirect

You can add a special < meta > tag inside your document's head to refresh the page at a set interval or to redirect users to different websites after a set delay .

```html
<meta http-equiv="refresh" content="30">
```

```html
<meta http-equiv="refresh" content="30;https://google.com">
```
Add Voice Recognition

Voice Recognition : This tricks is used to add voice search in the input field. Like Google search, it searches on by voice recognition.

Note : This will only work on mobile devices(Lolipop only Google Chrome).

```
<input type="text" x-webkit-speech />
```

Disable Right Clicking

Sometimes you might want to disable the context menu of the browser on your web page when the user right clicks ! This can easily be done using a simple trick !

Prevent right clicking the entire web page

```
<body oncontextmenu="return false">
```

Prevent right clicking a specific element

```
<section oncontextmenu="return false">Not Allowed</section>
```

4

Add Color Picker

This is a really cool HTML trick!

With HTML5, there are some really interactive customizations that visitors to your website will like.

This feature will be particularly user-friendly for those new to coding or without a lot of coding knowledge.

```html
<b>Color picker in input filed: </b>
<input type="color">
```

Capturing The User's Camera

For users who are on mobile devices, you can use the <input /> tag with a capture attribute to open the user's cameras and allow them to take a photo or video to upload to your website ! On desktop , the default behavior of uploading files is kept !

Opens back facing camera to take a video

```
<input type="file" capture="environment" accept="video/*">
```

Opens front facing camera to take a photo

```
<input type="file" capture="user" accept="image/*">
```
